Correction

In the article “Long-Term Outcome of Adolescent Depression Initially Resistant to Selective Serotonin Reuptake Inhibitor Treatment: A Follow-Up Study of the TORDIA Sample,” by Benedetto Vitiello, MD, and colleagues, published in the March 2011 issue (*J Clin Psychiatry* 2011;72[3]:388–396), the SIQ-Jr mean score at 72 weeks on page 391 should be about 10, the number of youths who attempted suicide and had a SIQ-Jr score above 31, indicative of elevated suicidal risk, on pages 392 and 394 should be 2, and the y-axis labels in both parts of Figure 4 should range from 5 to 35. The authors state that because the magnitude of differences in the SIQ-Jr is unchanged, none of the errors affects the interpretation of the results or conclusions. The online version of the article has been corrected.
